Material

Vertex climbing holds use the latest, revolutionary formula of Polyurethane resin Dannomond.

Dannomond is a high-performance pure Polyurethane used primarily in the production of indoor climbing holds. Characteristics like higher wear resistance, bright colors, dry soft texture and superior strength make it the first choice material for Climbing holds. Route setters and gym owners alike appreciate the long life and ease of route setting it imparts in the holds.

Attachment system-

Each one of our climbing holds has its own bolt depending on the depth of the fixation hole. That way the head of the bolt is on the surface of the hold
So there is no risk the climber to use the hole in case that the bolts is short and cause himself injury during his climbing
